General definitions

Table 1 lists some general definitions relevant for this document.

Table 1: General definitions.

Item	Definition
XCO_2	Column-averaged dry-air mixing ratios (mole fractions) of CO_2
XCH_4	Column-averaged dry-air mixing ratios (mole fractions) of CH_4
L1	Level 1 satellite data product: geolocated radiance (spectra)
L2	Level 2 satellite-derived data product: Here: CO_2 and CH_4 information for each ground-pixel
L3	Level 3 satellite-derived data product: Here: Gridded CO_2 and CH_4 information, e.g., 5 deg times 5 deg, monthly
L4	Level 4 satellite-derived data product: Here: Surface fluxes (emission and/or uptake) of CO_2 and CH_4

Scope of document

This document is a Product User Guide and Specification (PUGS) for the Copernicus Climate Change Service (C3S, https://climate.copernicus.eu/) component as covered by project C3S_312a_Lot6 led by University of Bremen, Germany.

Within project C3S_312a_Lot6 satellite-derived atmospheric carbon dioxide (CO_2) and methane (CH_4) Essential Climate Variable (ECV) data products will be generated and delivered to ECMWF for inclusion into the Copernicus Climate Data Store (CDS) from which users can access these data products and the corresponding documentation.

The C3S_312a_Lot 6 satellite-derived data products are:

- Column-average dry-air mixing ratios (mole fractions) of CO_2 and CH_4, denoted XCO_2 (in parts per million, ppm) and XCH_4 (in parts per billion, ppb), respectively.
- Mid/upper tropospheric mixing ratios of CO_2 (in ppm) and CH_4 (in ppb).

This document describes the C3S products CO2_IASA_NLIS, CH4_IASA_NLIS, CO2_IASB_NLIS, CH4_IASB_NLIS, CO2_AIRS_NLIS.

These products are mid-tropospheric CO_2 and CH_4 Level 2 products as retrieved from the IASI sensors on Metop-A and Metop-B and mid-tropospheric CO_2 from AIRS using algorithms developed at CNRS-LMD, France.

Executive summary

This document describes the data and metadata delivered to the Copernicus Climate Change Service (C3S) for the Level 2 CO_2 and CH_4 data products retrieved from IASI observations at CNRS-LMD. These products are mid-tropospheric-averaged dry-air mixing ratios (mole fractions) of CH4 and CO2, retrieved at 9:30 am/pm (local time) from observations made by the IASI and AMSU instruments onboard the European Metop-A (since July 2006) and Metop-B (since February 2013) platforms.

Data are provided as daily netCDF files available at the C3S website. Their content (data format, averaging kernels, geolocation information, etc.) as well as information on performances and limitations will be given.

1. Product description

1.1 The IASI instrument onboard the Metop platforms

The Infrared Atmospheric Sounding Interferometer (IASI) is a high resolution Fourier Transform Spectrometer based on a Michelson Interferometer coupled to an integrated imaging system that measures infrared radiation emitted from the Earth (https://iasi.cnes.fr/en/IASI/index.htm). Developed by the Center National d'Etudes Spatiales (CNES) in collaboration with the European Organisation for the Exploitation of Meteorological Satellites (EUMETSAT), IASI was launched in October 2006 onboard the polar orbiting Meteorological Operational Platform (Metop-A), and in September 2012 onboard Metop-B. A third IASI will be launched onboard Metop-C in October 2018.

IASI provides 8461 spectral samples, ranging from 645 cm^{-1} to 2760 cm^{-1} (15.5 µm and 3.6 µm), with a spectral sampling of 0.25 cm^{-1}, and a spectral resolution of 0.5 cm^{-1} after apodization. IASI is an across track scanning system, whose swath width is of 2200 km, allowing global coverage twice a day. The IFOV is sampled by 2×2 circular pixels whose ground resolution is 12 km at nadir at 9:30 am/pm local time.

The combined use of both Metop satellites, which are flying on the same orbit but with nearly half an orbit out of phase, yields a complete coverage of the Earth in one day. With the future launch of Metop-C, currently planned in 2018, these time series will cover about 20 years. In order to be useful for climate studies, it is mandatory that the time series derived from the 3 successive platforms are consistent in order to allow studying trends and growth rates.

1.2 CH_4 and CO_2 mid-tropospheric column averaged mole fractions

Four Level 2 products are described in this document:
- CH4_IASA_NLIS: mid-tropospheric column averaged mole fractions of CH_4 retrieved from IASI onboard Metop-A.
- CH4_IASB_NLIS: mid-tropospheric column averaged mole fractions of CH_4 retrieved from IASI onboard Metop-B.
- CO2_IASA_NLIS: mid-tropospheric column averaged mole fractions of CO_2 retrieved from IASI onboard Metop-A.
- CO2_IASB_NLIS: mid-tropospheric column averaged mole fractions of CO_2 retrieved from IASI onboard Metop-B.

Each of these products have been are retrieved from simultaneous observations of the IASI and AMSU instruments flying together onboard the Metop satellites using a non-linear inference scheme using Multi-Layer Perceptrons with 2 hidden layers. IASI hyperspectral observations in the thermal infrared at 7.7 µm (resp. 15 µm), which are sensitive to both temperature and gas concentrations of CH_4 (resp. CO_2) are used in conjunction with microwave observations form the AMSU instruments, only sensitive to temperature, to decorrelate both signals (*Crevoisier et al., 2009a, 2009b, 2013*).

Potential radiative systematic biases existing between simulations used in the inference scheme and observations are computed for each channel by averaging, over the intruments full years of operation, the differences between simulations and collocated (in time and space) satellite observations. The simulations are performed using the 4A/OP-2009 forward model (Scott and Chédin, 1981; http://www.noveltis.net/4AOP/), which is based on the updated 2011 version of the GEISA spectroscopic database (available at http://ether.ipsl.jussieu.fr/) (Jacquinet-Husson et al., 2011), and radiosonde measurements from the Analyzed RadioSoundings Archive database (available at http://ara.lmd.polytechnique.fr). IASI calibrated radiance spectra (level1c) are received through the EUMETCast near real time data distribution service via the French Ether center (http://ether.ipsl.jussieu.fr).

The retrieved CO_2 and CH_4 integrated columns are weighted to the tropical mid-troposphere with peak sensitivity at about 230 hPa (~11 km), half the peak sensitivity at 100 and 500 hPa (~6 and 16 km), and no sensitivity to the surface. Retrievals are performed over land and sea, by night and day (9:30 am/pm local time) for clear-sky only (no clouds, no aerosols). The CO_2 retrievals are limited to the tropical region (30N:30S) because of the greater stability of the temperature atmospheric profile, which helps decorrelating temperature from gas in the observed radiances, yielding a much better precision compared to the extratropics.

Through comparisons with regular aircraft (*Machida et al., 2008)* or balloon *(Membrive et al., 2017*) measurements as well as observations made at the surface, it has been shown that, once the radiometric characterization of the instruments is performed, IASI and AMSU capture well the trend and interannual variation of CH_4, with an excellent agreement with the rate of increase measured at the surface, giving confidence in the ability of IASI to follow its evolution over the 20 years of the Metop program.

Figure 1 shows the daily coverage provided by the use of both Metop-A and Metop-B in terms of mid-tropopsheric CH_4. Figures 2 shows the monthly time series of mid-tropospheric CO_2 as retrieved from IASI onboard Metop-A.

Figure 1: Daily maps of CH_4 mid-tropospheric column averaged mole fraction retrieved from Metop-A, from Metop-B and from both platform for September, 15[th], 2013.

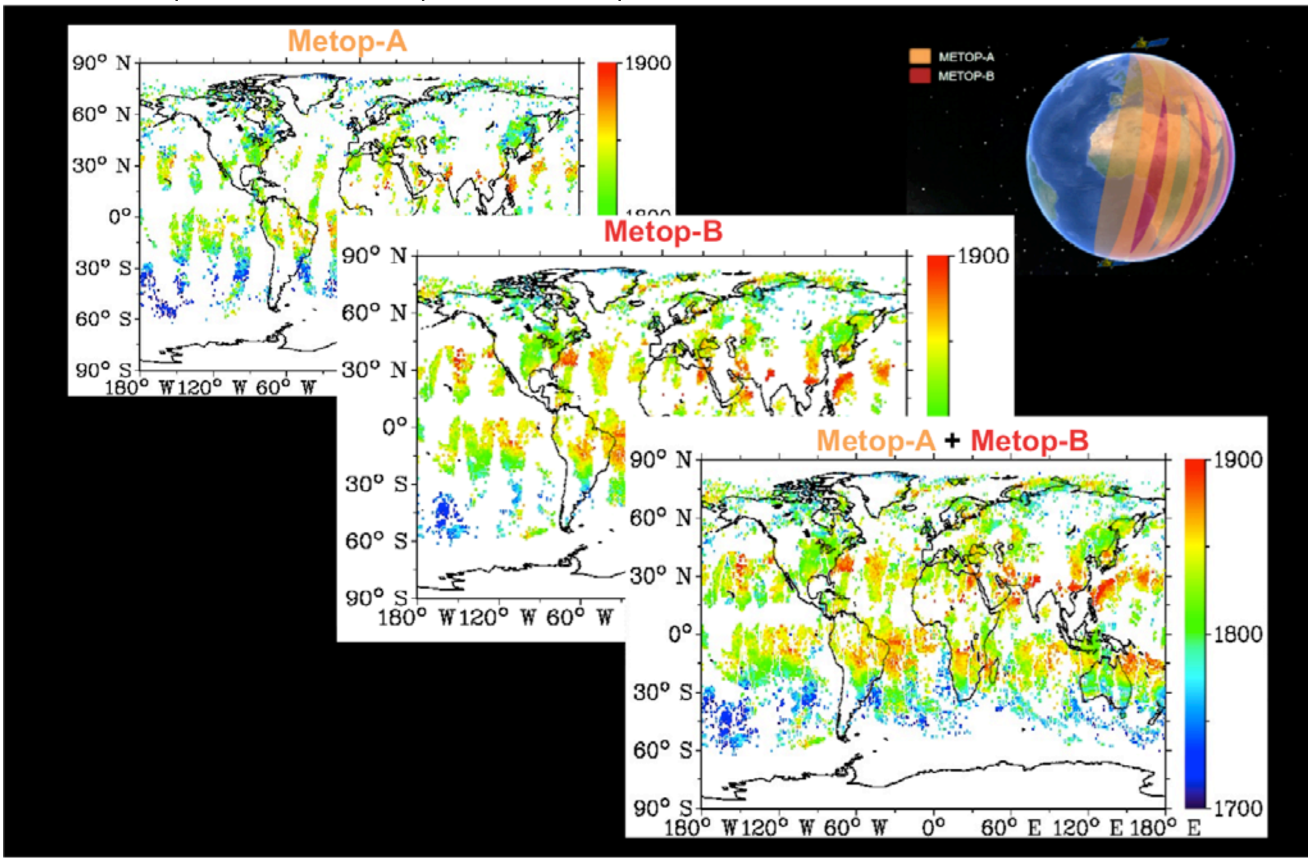

Figure 2: Monthly evolution displayed as a function of latitude of CO_2 mid-tropospheric column averaged mole fraction retrieved from Metop-A.

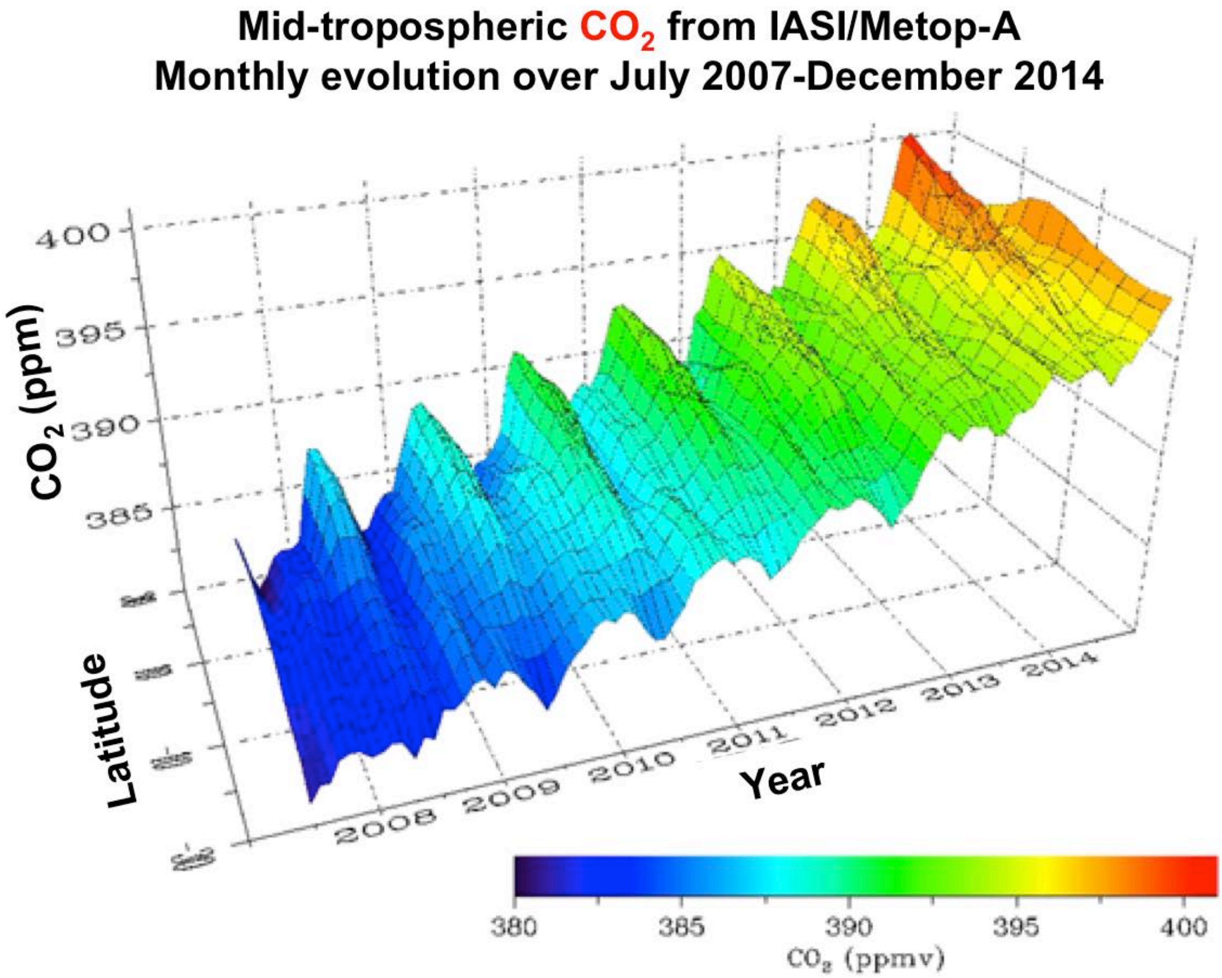

1.3 AIRS CO_2 mid-tropospheric column averaged mole fractions

Also described in this document is the Level 2 mid-tropospheric column averaged mole fractions retrieved from simultaneous observations of the AIRS and AMSU instruments flying together onboard the Aqua satellite since 2002 using a non-linear inference scheme (*Crevoisier et al., 2003*). This dataset covers the period January 2003-June 2006. Although AIRS being still in operation, the loss of several channels that were used in the retrieval has stopped the generation of retrievals. As part of C3S, the dataset generated during the ESA-CCI-GHG initiative has been rewritten in daily netcdf files, following the same structure as for the other products.

2. Target requirements

Quality requirements for Level 2 products generated from IASI and delivered to C3S are discussed in the Target Requirements Document (*TRD GHG, 2017*). Table 1 shows the random and systematic errors stated in the TRD. The evaluation itself of our products is described in the PQAR Document.

Table 1: Mid/upper tropospheric CO_2 and CH_4 random (“precision”) and systematic retrieval error requirements. Abbreviations: G=Goal, B=Breakthrough, T=Threshold requirement. §) Required systematic error after an empirical bias correction, that does not use the verification data. #) Required systematic error and stability after bias correction, where bias correction is not limited to the application of a constant offset / scaling factor.

Random and systematic error requirements for mid/upper tropospheric CO_2 and CH_4					
Parameter	**Req. type**	**Random error** (“Precision”)		**Systematic error**	**Stability**
		Single obs.	1000^2 km^2 monthly		
CO_2	G	< 1 ppm	< 0.3 ppm	< 0.2 ppm (absolute)	As systematic error but per year
	B	< 3 ppm	< 1.0 ppm	< 0.3 ppm (relative §))	-“-
	T	< 8 ppm	< 1.3 ppm	< 0.5 ppm (relative #))	-“-
CH_4	G	< 9 ppb	< 3 ppb	< 1 ppb (absolute)	< 1 ppb/year (absolute)
	B	< 17 ppb	< 5 ppb	< 5 ppb (relative §))	< 2 ppb/year (relative §))
	T	< 34 ppb	< 11 ppb	< 10 ppb (relative #))	< 3 ppb/year (relative #))

3. Data usage information

3.1 Product content and format

The daily Netcdf files contain all of the common parameters for the C3S data products. The mid-tropospheric column averaged mole fractions of CH_4 (ppb) and CO_2 (ppm) are stored in the ch4 and co2 variables. The quality flags (0=good) must be applied before use. Averaging kernels are provided on pressure layers (pressure-weight), as opposed to layers. A dimension of *n* refers to the number of retrievals per file. A dimension of *m* refers to the number of levels used in the radiative transfer retrieval process.

Table 2: Variables present in the Netcdf file for the CH4_IASA_NLIS and CH4_IASB_NLIS products.

Name	Type	Dimension	Units	Description
latitude	float	n	degrees_north	Center latitude of the measurement
longitude	float	n	degrees_east	Center longitude of the measurement
time	float	n	seconds since 1970-1-1 0:0:0	Measurement time
solar_zenith_angle	float	n	degrees	Angle between line of sight to the sun and local vertical
sensor_zenith_angle	float	n	degrees	Angle between the line of sight to the sensor and the local vertical
ch4_quality_flag	byte	n		0=good, 1=bad
ch4	float	n	1e-9	Retrieved mid-tropopsheric column of atmospheric methane (CH_4) in ppb
ch4_uncertainty	float	n	1e-9	1-sigma uncertainty of the retrieved Mid-tropospheric-CH_4 in ppb
ch4_averaging_kernel	float	n, m		Normalized column-averaging kernel, which represents the sensitivity of the retrieved mid-tropospheric CH_4 to the atmospheric methane mole fraction depending on pressure (height). All values represent layer averages within the corresponding pressure levels.
pressure_levels	float	n, m	hPa	Pressure levels define the boundaries of the averaging kernel. Surface pressure is represented by the 1st element, i.e., profiles are ordered from surface to top of atmosphere.
pressure_weight	float	n, m	hPa	Layer dependent weights corresponding to pressure levels

Table 3: Variables present in the Netcdf file for the CO2_IASA_NLIS, CO2_IASB_NLIS and CO2_AIRS_NLIS products.

Name	Type	Dimension	Units	Description
latitude	float	n	degrees_north	Center latitude of the measurement
longitude	float	n	degrees_east	Center longitude of the measurement
time	float	n	seconds since 1970-1-1 0:0:0	Measurement time
solar_zenith_angle	float	n	degrees	Angle between line of sight to the sun and local vertical
sensor_zenith_angle	float	n	degrees	Angle between the line of sight to the sensor and the local vertical
co2_quality_flag	byte	n		0=good, 1=bad
co2	float	n	1e-6	Retrieved mid-tropopsheric column of atmospheric methane (CO_2) in ppm
co2_uncertainty	float	n	1e-6	1-sigma uncertainty of the retrieved Mid-tropospheric-CO_2 in ppm
co2_averaging_kernel	float	n, m		Normalized column-averaging kernel, which represents the sensitivity of the retrieved mid-tropospheric CO_2 to the atmospheric methane mole fraction depending on pressure (height). All values represent layer averages within the corresponding pressure levels.
pressure_levels	float	n, m	hPa	Pressure levels define the boundaries of the averaging kernel. Surface pressure is represented by the 1st element, i.e., profiles are ordered from surface to top of atmosphere.
pressure_weight	float	n, m	hPa	Layer dependent weights corresponding to pressure levels

3.2 Tools for reading data

Data are provided in Netcdf files that can easily be read with standard tools in any common programming languages.

3.3 Recommended data usage

For model comparison or for intercomparison with in-situ or remote-sensing measurements for which vertical profile information is available, use should be made of the provided normalized-column averaging kermels, denoted *G*. The 40 G_i values are independent of the layer thickness and can be interpolated to any vertical layer distribution. Note that they are normalized so that the sum of the G_i, weighted by layer pressure thickness, is 1. The simulated integrated content of the consider gas, denoted q_{gas}^{other}, is finally given by

$$q_{gas}^{other} = \frac{\sum_{i=1}^{M_{lay}} H_i \Delta p_i q_i}{\sum_{i=1}^{M_{lay}} H_i \Delta p_i}$$

where H_i is the vertical weithing function G_i interpolated on the M_{lay} pressure layers Δp_i used by the other product q_i given in ppb.

3.4 Known limitations and issues

• From September 2015, AMSU channel 7 has started degrading and exceeding specifications. Retrievals performed from IASI/AMSU onboard Metop-A have thus been stopped. The regeneration of the full dataset without the information given by AMSU7 will be performed for next release.
• For high scan angles (between 10th and 15th), the retrievals display a variation with the scan angle that depends on the year, and than can reach quite high values at the edges of the orbits. For these reason, only retrievals for scan angles lower than the 10th angle are provided.
• A bias of about 2 ppm has been observed on the Co2 retrieved from Metop-B. This bias will be further studied during the validation exercises.
