

ECMWF COPERNICUS REPORT

Copernicus Climate Change Service

Product Quality Assessment Report (PQAR) – ANNEX C for product CH4_GOS_SRPR (v2.3.9, 2009-2019)

C3S_312b_Lot2_DLR – Atmosphere

Issued by: Lianghai Wu, SRON, The Netherlands Date: 18/08/2020 Ref: C3S_D312b_Lot2.2.3.2-v2.0_PQAR-GHG_ANNEX-C_v4.0 Official reference number service contract: 2018/C3S_312b_Lot2_DLR/SC1

This document has been produced in the context of the Copernicus Climate Change Service (C3S). The activities leading to these results have been contracted by the European Centre for Medium-Range Weather Forecasts, operator of C3S on behalf of the European Union (Delegation Agreement signed on 11/11/2014). All information in this document is provided "as is" and no guarantee or warranty is given that the information is fit for any particular purpose. The user thereof uses the information at its sole risk and liability. For the avoidance of all doubts, the European Commission and the European Centre for Medium-Range Weather Forecasts has no liability in respect of this document, which is merely representing the authors view.

General definitions

Table 1 lists some general definitions relevant for this document.

Table 1: General definitions.

Item	Definition		
XCO ₂	Column-averaged dry-air mixing ratios (mole fractions) of CO ₂		
XCH ₄	Column-averaged dry-air mixing ratios (mole fractions) of CH ₄		
L1	Level 1 satellite data product: geolocated radiance (spectra)		
L2	Level 2 satellite-derived data product: Here: CO ₂ and CH ₄ information for each ground-pixel		
L3	Level 3 satellite-derived data product: Here: Gridded CO_2 and CH_4 information, e.g., 5 deg times 5 deg, monthly		
L4	Level 4 satellite-derived data product: Here: Surface fluxes (emission and/or uptake) of CO_2 and CH_4		

Scope of document

This document is a Product Quality Assessment Report (PQAR) for the Copernicus Climate Change Service (C3S, <u>https://climate.copernicus.eu/</u>) greenhouse gas (GHG) component as covered by project C3S_312b_Lot2.

Within this project satellite-derived atmospheric carbon dioxide (CO₂) and methane (CH₄) Essential Climate Variable (ECV) data products will be generated and delivered to ECMWF for inclusion into the Copernicus Climate Data Store (CDS) from which users can access these data products and the corresponding documentation.

The GHG satellite-derived data products are:

- Column-averaged dry-air mixing ratios (mole fractions) of CO₂ and CH₄, denoted XCO₂ (in parts per million, ppm) and XCH₄ (in parts per billion, ppb), respectively.
- Mid/upper tropospheric mixing ratios of CO₂ (in ppm) and CH₄ (in ppb).

This document describes the validation / quality assessment of C3S product CH4_GOS_SRPR.

These products are XCO₂ and XCH₄ Level 2 products as retrieved from GOSAT using algorithms developed at SRON, The Netherlands.

Executive summary

This report summarizes the performance of the RemoTeC CH4_GOS_SRPR retrievals. In general, we find very good agreement with TCCON data for all three modes (gain H, gain M and sunglint). All have a very high degree of correlation with TCCON (R~0.9).

The station to station bias is 2.75 ppb and a standard deviation of around 14.47 ppb is observed for most TCCON stations. We also checked the stability of the bias over time as the GOSAT time series now spans a period of 10.5 years and found that there has been no significant change in the bias over time, indicating a very good detector stability. We achieved both Target Requirement (TR) requirements for accuracy and stability with 100 % in both cases.

1. Product validation methodology

Validation of the CH4_GOS_SRPR is performed by comparison a selection of ground-based FTS TCCON stations. These provide total column XCH4 measurements that are used to filter our retrievals and perform a bias correction of our data product. The final filtered and bias corrected product is then compared to TCCON to evaluate the global bias, retrieval accuracy and systematic biases (spatial and temporal) in the retrievals. In this validation the TCCON GGG2014 official release has been used.

1.1 Co-location method

We co-locate the GOSAT soundings with the TCCON measurements using the following criteria:

- GOSAT sounding within ±5 latitude and ±8 longitude of TCCON station
- GOSAT sounding within ±2 hours of TCCON measurements

In previous studies we have also employed a dynamic co-location method, based on a TM5-4DVAR forward model run. This essentially compares the modeled CO2 concentration at a GOSAT sounding and the TCCON site and co-locates the soundings if the CO2 concentrations are within 0.25 (or 0.5) ppm of each other. This is then used as a tracer for atmospheric transport. However, at the time of validating this dataset the dynamic co-locations for the newest year were not yet available. We therefore decided to use a box filter instead as we did want to include the newest year's data in our validation and wanted the whole dataset to have a consistent method for co-locating the GOSAT soundings.

We then average all the TCCON measurements within ±2 hours of a GOSAT measurement to create a set of GOSAT-TCCON pairs. These co-located pairs are then used to perform the validation procedure. Figure 1-3 shows the co-located example soundings for the gain H, gain M and sunglint stations respectively.

Figure 1: GOSAT co-located example soundings for each TCCON station for gain H soundings. The map shows the elevation with dark green being low elevations and light green showing elevated areas. The blue stars show the location of the TCCON site, while the red dots are co-located GOSAT soundings. Top to down (left column) stations: Bialystok, Darwin, Karlsruhe, Orleans, Saga, Wollongong. Top to down (right column) stations: Bremen, Garmisch, Lamont, Park Falls, Sodankyla.

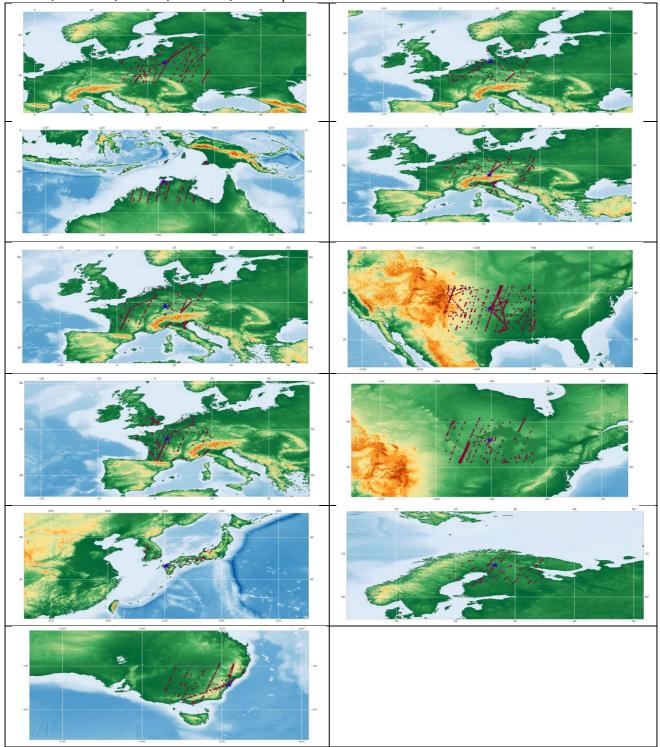

Figure 2: As Fig 1 but for gain M soundings. Stations are Dryden (left) and Wollongong (right).

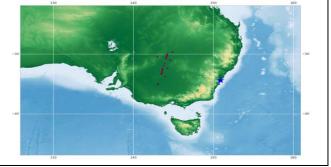

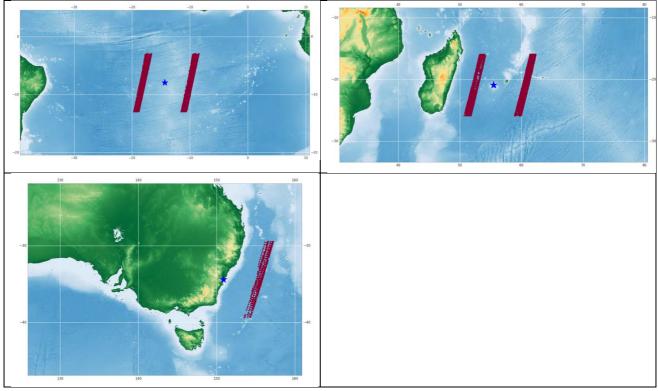

Figure 3: As Fig 1 but for sunglint soundings. Stations are Ascension (top left), Izana (top right), Reunion (bottom left) and Wollongong (bottom right).

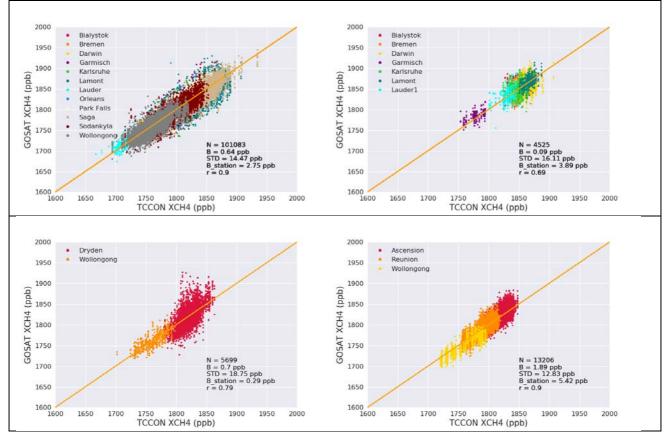

2. Validation Results

2.1 Product CH4_GOS_SRPR

2.1.1 Validation

Figure 4: Validation of XCH₄ retrieved by GOSAT-RemoTeC with ground based TCCON measurements for gain H (Top left), gain H year 2019 only (top right), gain M (bottom left) and sunglint (bottom right) soundings. N(coloc) indicates the number of GOSAT-TCCON colocations, B indicates the bias between GOSAT and TCCON, and STD the standard deviation of the GOSAT TCCON difference (for individual measurements) and B_station the station to station bias.

The above figures all show a strong correlation of the retrieved (bias-corrected) XCH4 with the TCCON XCH4 (r \sim 0.9). This gives us confidence that our bias correction based on the retrieved albedo works correctly and takes out most of the bias. The 2019 only data shows a remaining bias of 0.09 ppb.

The figure below (Fig 5) shows in detail for each station the remaining bias and standard deviation for the co-located GOSAT soundings. Unlike for the CO2_GOS_SRFP dataset, we do not include Izana here in the gain M validation, as its high altitude causes a large offset between measurements at the TCCON station and the Sahara desert.

In the case of gain H, the station to station standard deviation is 2.75 ppb. Saga also remains an outlier with a strong remaining negative bias, possibly due to inclusion of soundings in more polluted areas. Garmisch and Park Falls both show a positive offset, possibly due to the elevation of the TCCON stations (740 and 440 m respectively). Lamont clearly shows the most co-locations and dominates the total statistical comparison.

For gain M and sunglint we removed Darwin from the comparison as using the static spatial colocation criterion it only had limited co-located measurements.

Figure 5: The bias, standard deviation and # of measurements per station for gain H (top), gain M (middle) and sunglint (bottom) soundings for the period between the year 2009 and 2019.

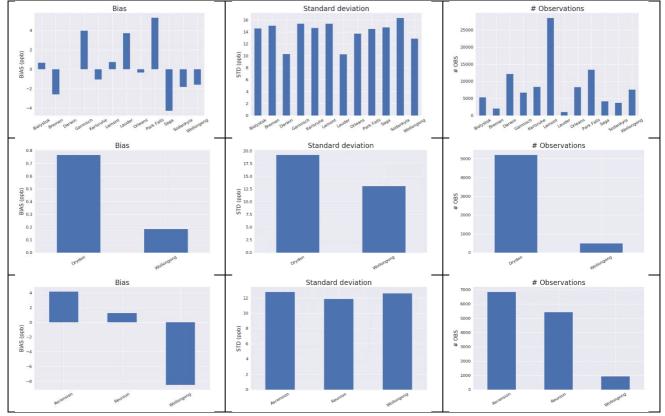

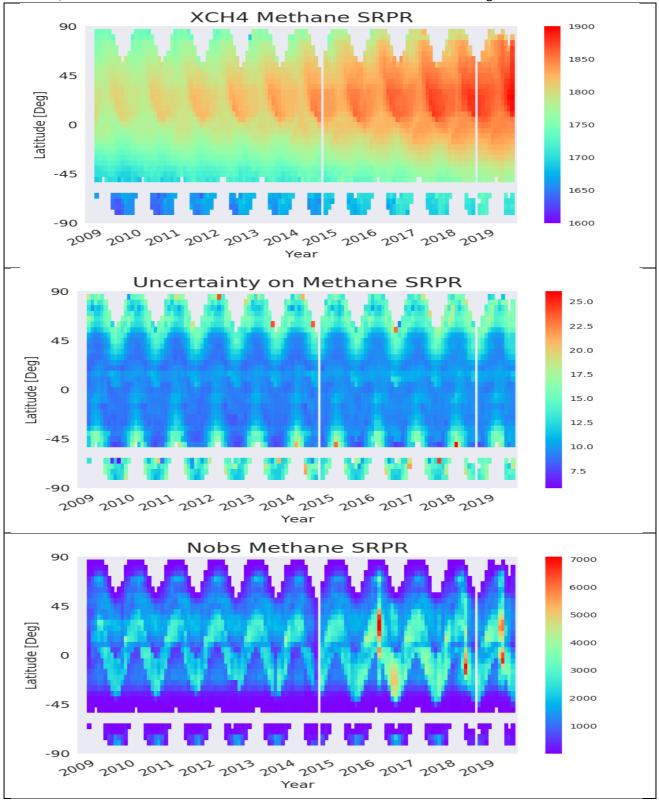

Figure 6: The CH4_GOS_SRPR global dataset in slices of 10 degrees latitude as a function of time. The increase in XCH4 concentrations during the last couple of years can clearly be seen. The gap in data coverage during Dec 2014, Jan 2015 and December 2018 is due to GOSAT maintenance and testing.

2.1.2 Stability

Stability (both linear and year-to-year variability) is an essential part of the validation and can reveal potential degradation or other time-dependent effects in the GOSAT data products.

Fig. 7-11 show the time series for the individual stations. As can be seen the time coverage for different stations can differ significantly and occasionally gaps occur due to maintenance of the TCCON station.

To determine the linear stability, we add all co-located TCCON measurements together and fit a linear relation to the remaining bias as a function of time. The year-to-year bias variability is the difference between the minimum of the bias in one year versus the maximum of the bias in one year. The results are shown in Table 2.

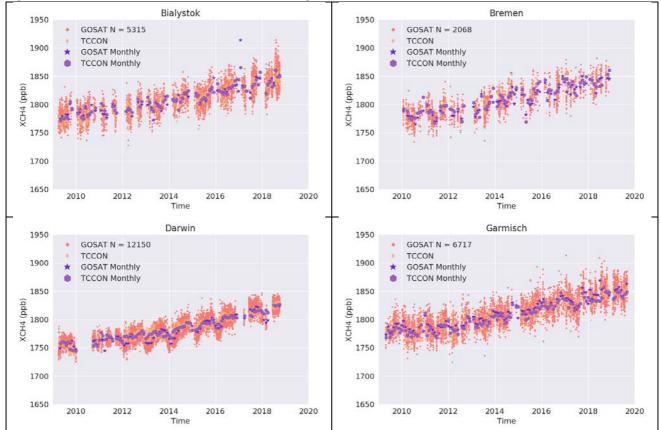

Figure 7: Timeseries for the individual stations for gain H.

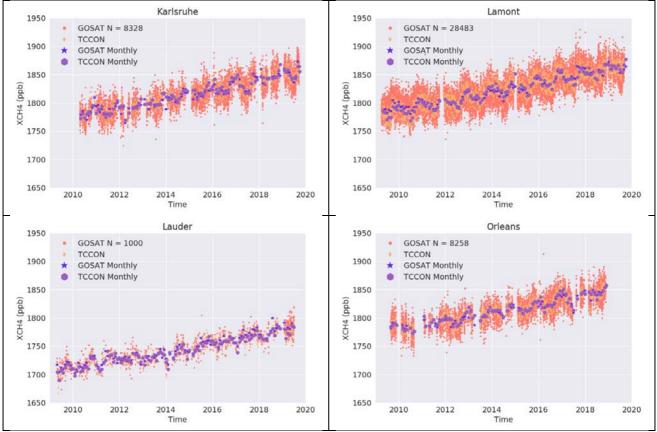

Figure 8: Timeseries for the individual stations for gain H (continued from Fig 6).

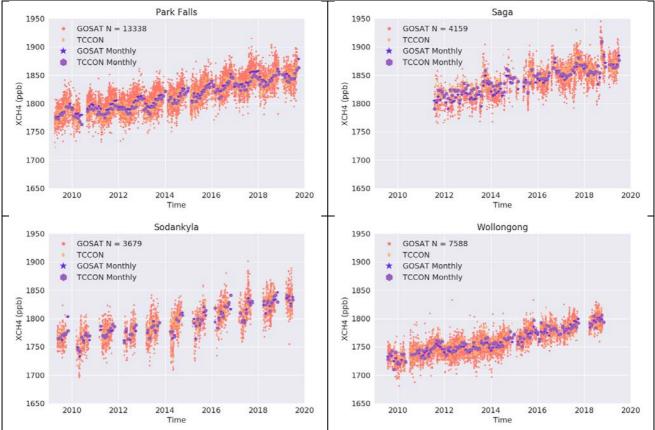

Figure 9: Timeseries for the individual stations for gain H (continued from Fig 6).

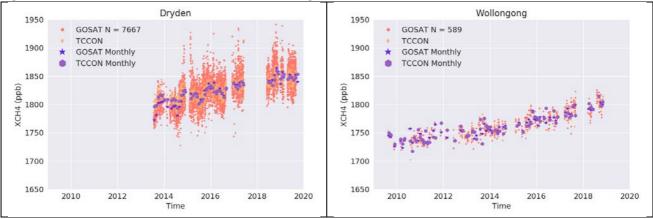

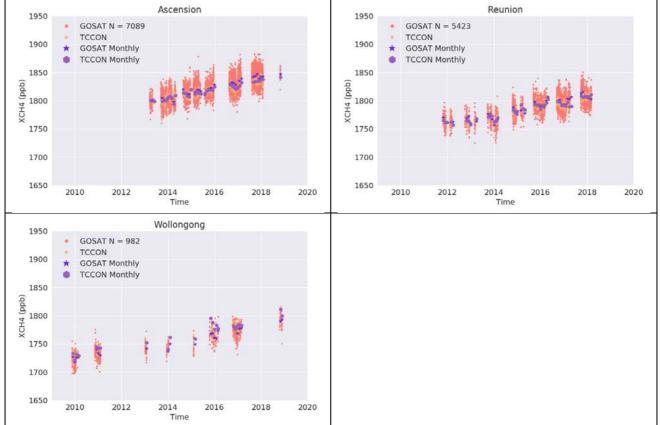

Figure 10: Timeseries for the individual stations for gain M.

2.1.3 Validation summary

The validation results are summarized in the table below.

Table 2 - Product Quality	y Summary	Table for	product CH4	GOS SRPR.

Product Quality Summary Table for Product: CH4_GOS_SRPR Level: 2, Version: 2.3.9, Time period covered: 6.2009 – 12.2019					
Parameter [unit]	Achieved performance	Requirement	TR	Comments	
Single measurement precision (1-sigma) in [ppb]	14.42	< 34 (T) < 17 (B) < 9 (G)	-	-	
Uncertainty ratio) in [-]: Ratio reported uncertainty to standard deviation of satellite-TCCON difference	1.26	-	-	No requirement but value close to unity expected for a high quality data product.	
Mean bias [ppb]	0.64	-	-	No requirement but value close to zero expected for a high quality data product.	
Accuracy: Relative systematic error [ppb]	Spatial – spatiotemporal: 2.75 – 5.42	< 10	Probability that accuracy TR is met: 92%	-	
Stability: Linear bias trend [ppb/year]	-0.29 +/- 0.25 (1-sigma)	< 3	Probability that stability TR is met: 99%	-	
Stability: Year-to-year bias variability [ppb/year]	7.83 +/- 2.51 (1-sigma)	< 3	-	-	

3. Application(s) specific assessments

No application specific assessments have been carried out.

4. Compliance with user requirements

For the CH4_GOS_SRPR product we achieved 100% for TR's Accuracy and 100 % for TR's Stability
