Contents

Planned and Realised Validation Activities at the University of Frankfurt by balloon borne cryogenic whole air sampling.

Balloon Validation: cryosampler BONBON

Analytical Improvements and characterisation

Validation Results for CH₄ and N₂O in comparison to MIPAS-E

Conclusion, Summary and Outlook

The TRIPLE Gondola and its instruments

Independant in-situ measurements

Three main instruments:

- ✉ Cryogenic Whole air sampler BONBON
- ✉ Lyman - alpha Hygrometer FISH
- ✉ Chemical Conversion Resonance Fluorescence BrO/ClO

Guest instrument for SCIA validation flight:

- ✉ Tunable diode laser instrument CHILD

Planned and Realised Balloon Observations

Date	Launch site	comment
24.09.2002	Aire sur l'Adour, France, (44°N, 0°W)	succesfull mid latitude flight, up to 33 km
06.03.2003	Esrangle, Kiruna Sweden 68°N, 21°E	succesfull high latitude flight, up to 32 km
09.06.2003	Esrangle, Kiruna Sweden 68°N, 21°E	succesfull high latitude flight, up to 32 km
Fall 2004	tropics	launch site and date under discussion

Cryosampler BONBON on the TRIPLE Gondola

Analytical work and characterisation

- ☞ Main Problem with retrieving **high accuracy** measurements is the characterisation of the detector response. For ECDs this is often a non-linear function of the amount of the respective compound.
- ☞ Response may also be influenced by co-elution and doping effects.
- ☞ Unproblematic for CH₄ and CO₂ (FID is highly linear).
- ☞ Non-linearity of ECD response for CFCs can be characterised by a dilutions series
- ☞ N₂O is non-linear and may cross interfere with the amount of CO₂ in the sample (internal doping)

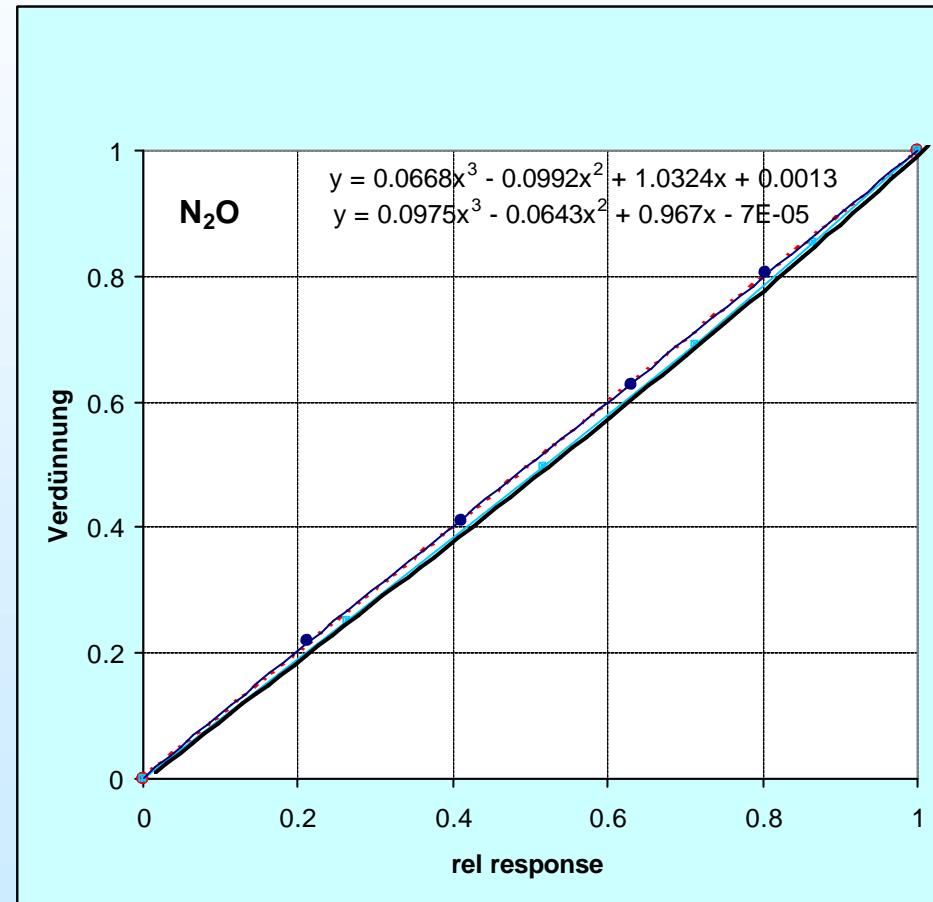

Comparison of N₂O non-linearity tests

Blue squares:
constant CO₂
dilution series

turquoise points:
CO₂-diluted
dilution series

differences of up to
5 ppb between three
independant N₂O
measurements remain

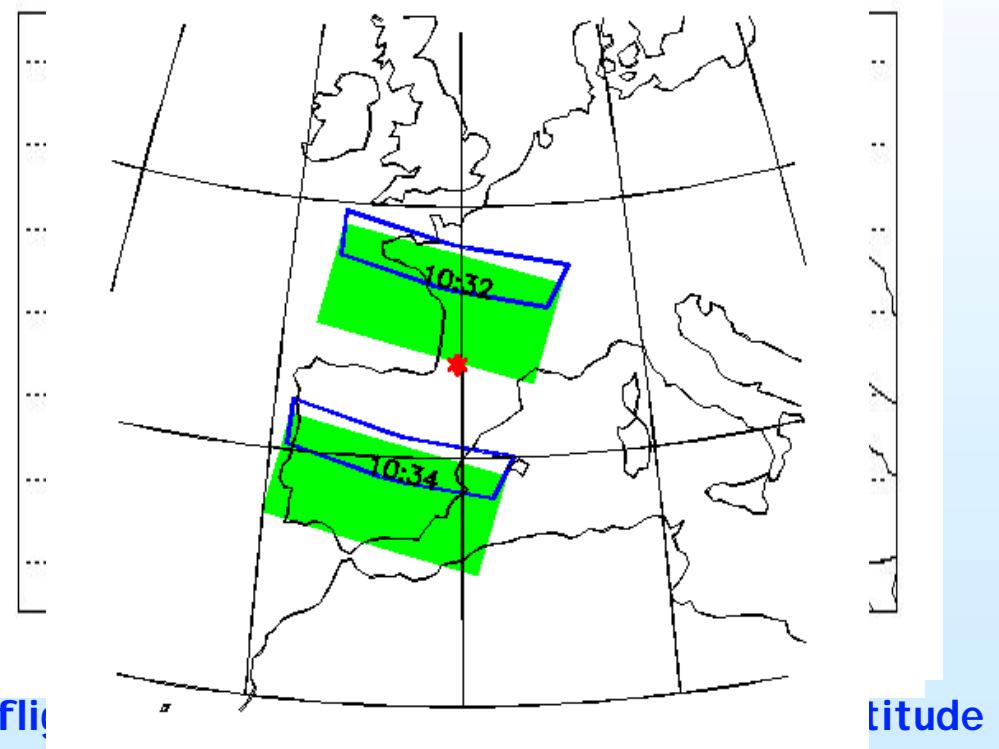

Balloon Flight on 24.9.2002

CO LOCATION SCIAMACHY - LIMB

good co-location with
orbit 2968

Back and Forward Trajectories started along flight

SCIAMACHY overpasses on 24-SEP-2002

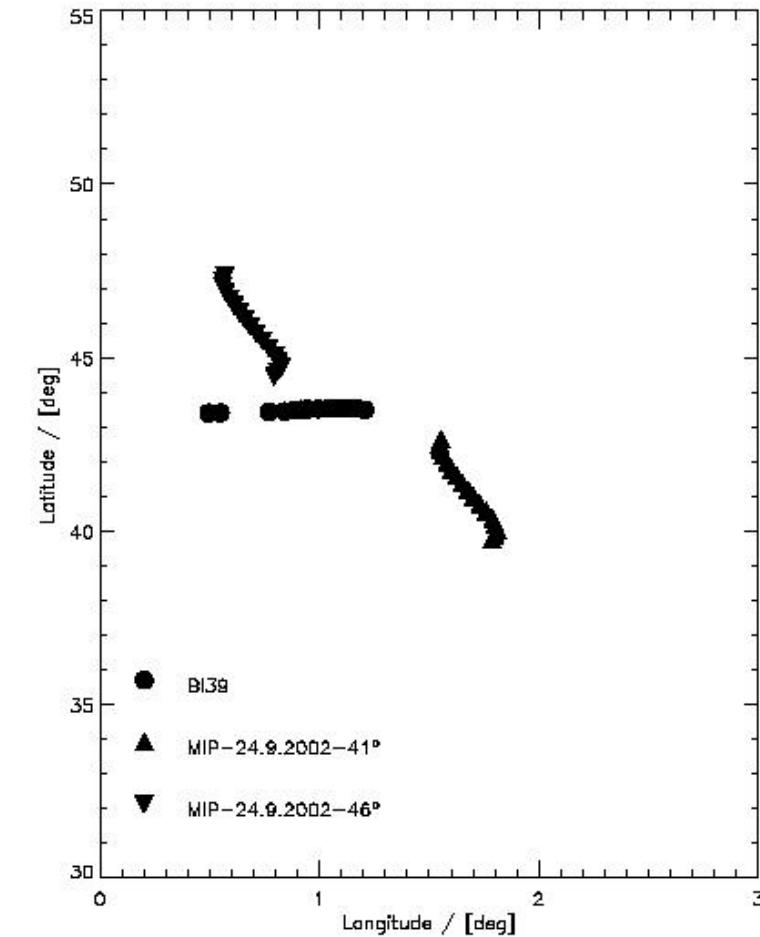

Balloon Flight on 24.9.2002

CO LOCATION
MIPAS - E
orbit 2975
12 hrs time delay

much better timely match
with orbit 2968

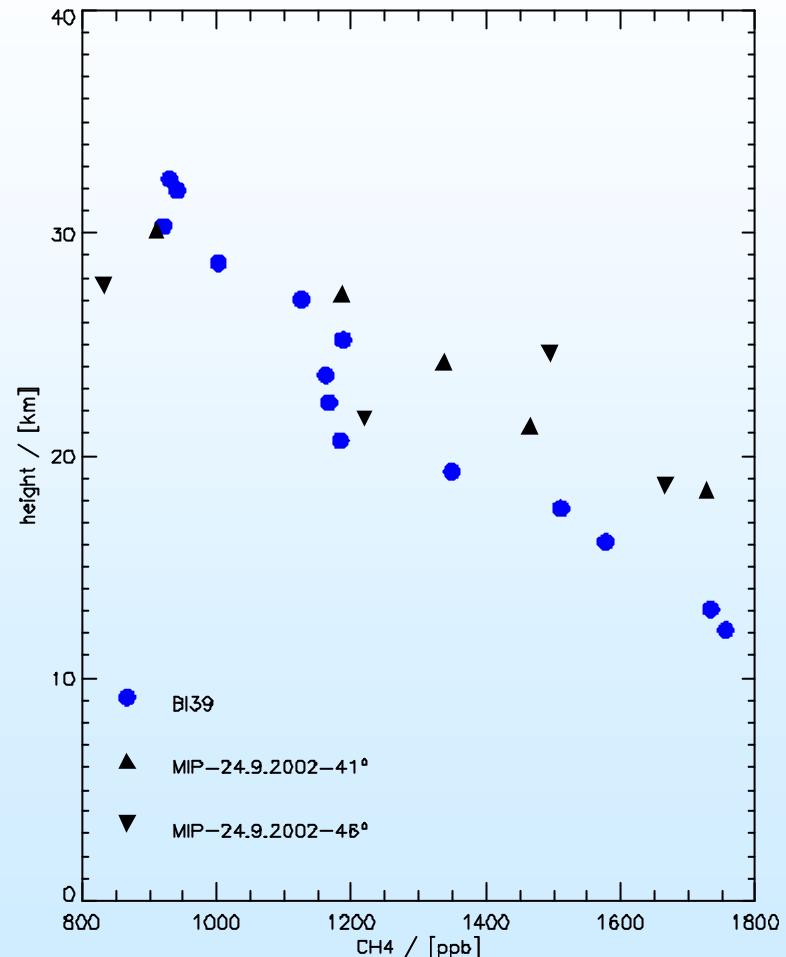

DATA INTERCOMPARISON:

24.9.2002

Methane

MIPAS: triangles
(orbit 2975)

TRIPLE (BONBON): dots

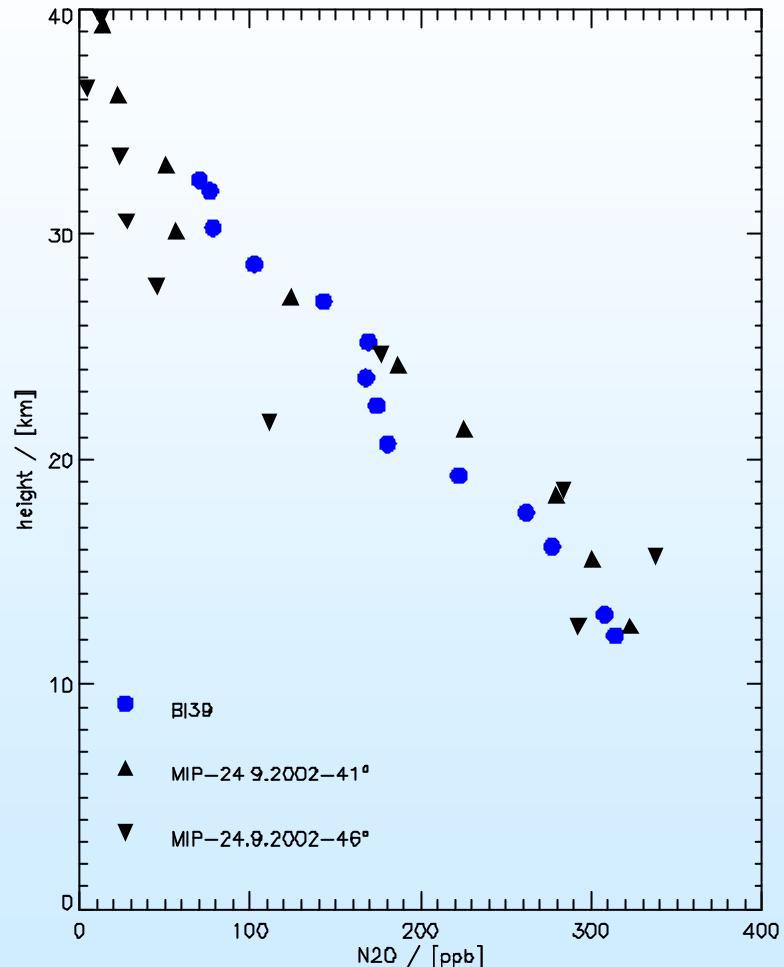

DATA INTERCOMPARISON:

24.9.2002

N_2O

MIPAS: triangles
(orbit 2975)

TRIPLE (BONBON): dots

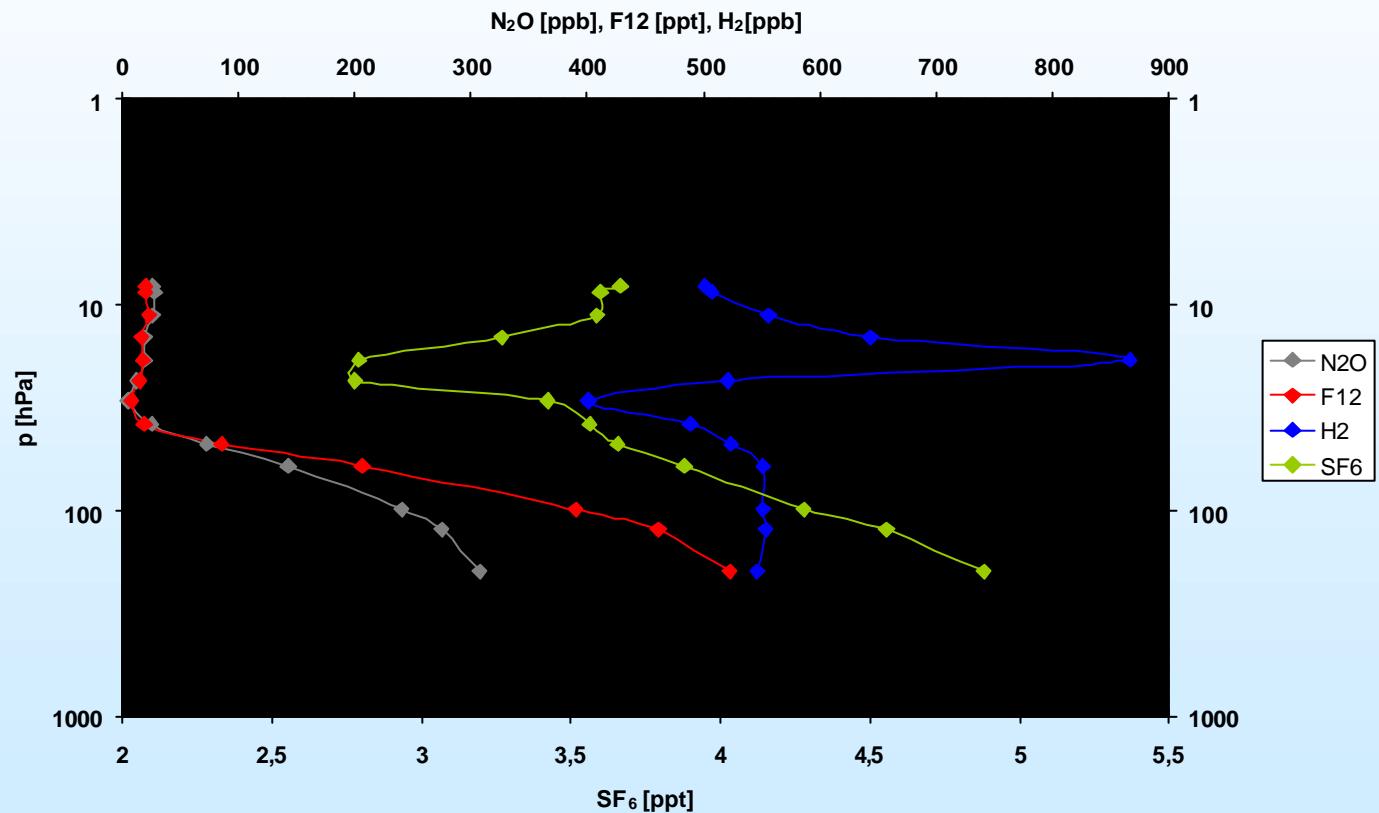

TRIPLE Validation Flight on 6.3.2003

No Satellite
Data available

Good co-location with
MIPAS-E and SCIA
inside vortex
measurements

SF₆ loss
mesospheric air

Further Validation Activities

- ☛ Tropical validation flight envisaged for fall 2004
- ☛ Long-term validation to be determined.
- ☛ Validation time schedule depending on data availability
- ☛ intercomparisons to be enhanced by mapping (ongoing activity)
 - ☛ balloon trajectories have been transferred to FU Berlin
 - ☛ list of satellite matches (+/- 5 days) will be produced
- ☛ ongoing work in characterisation of representative response functions for GC/ECD system

Conclusions and Summary

Generally reasonable co-locations in time and space with SCI AMACHY and MIPAS-E for all three balloon flights.

No SCI AMACHY limb data available so far

MIPAS-E CH₄ and N₂O data show much larger scatter than the BONBON in situ observations.

MIPAS-E CH₄ profiles exhibit mostly a high bias (up to 30%) below 25 km compared to BONBON

MIPAS-E N₂O profiles show mostly reasonable (~15%) agreement with the in situ data, but exhibit a significant low bias compared to midlatitude BONBON data above 22km on Sept. 24, 2002.
