# Overview

---

- Scientific objective
- Instrument and measurement ( previous presentation)
- Data analysis
- Results
- Comparison with GOME and SCIAMACHY
- Summary

Universität Bremen  
Ping.Wang@iup.physik.uni-bremen.de

# Scientific object

---

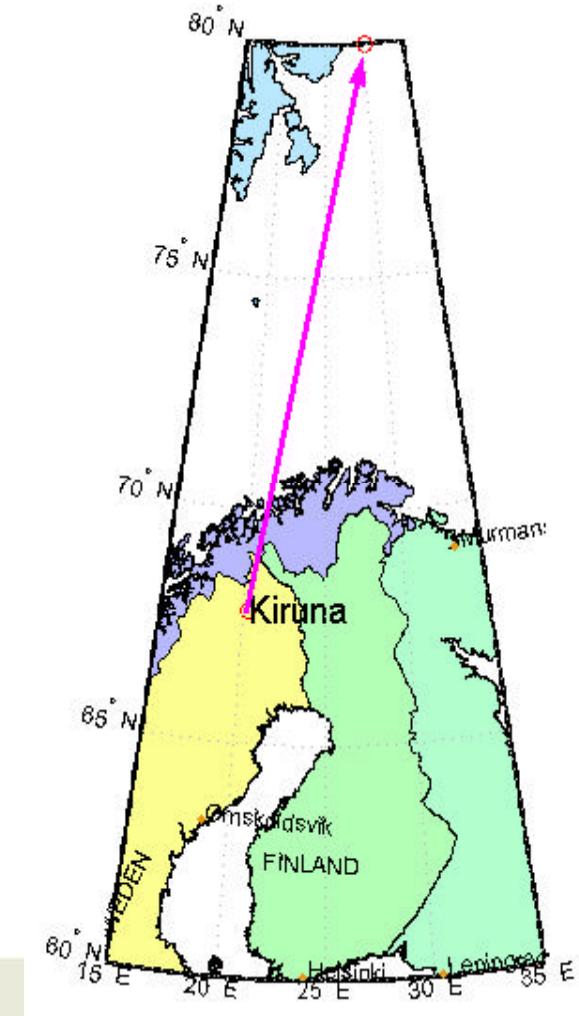

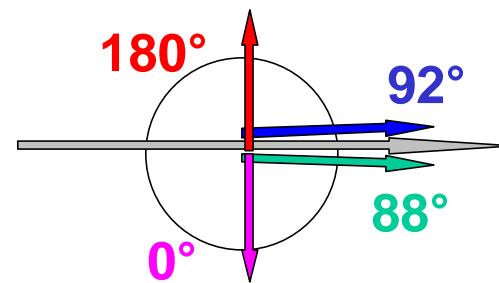

- Halogen chemistry -- ozone loss – qualitative and quantitative
- Models underestimate the ozone loss rate, need more measurement data
- Match with other measurements
- OCIO is an indicator of ClO at SZA < 92°
- Part of objective of EUPLEX campaign

# AMAXDOAS: OCIO data analysis

## Differential Optical Absorption Spectroscopy (DOAS) method

- **Data** January 26th, 2003  
Kiruna( $67.82^{\circ}\text{N}$ ,  $20.34^{\circ}\text{E}$ ) to the north east,  
return at ( $80^{\circ}\text{N}$ ,  $30^{\circ}\text{E}$ )
- **Viewing directions**  
 $180^{\circ}$ ,  $92^{\circ}$ ,  $88^{\circ}$ ,  $0^{\circ}$ .  
Nadir  $0^{\circ}$ , flight direction  $90^{\circ}$
- **Flight altitude 11km**

# Summary

---

- During the EUPLEX campaign, the AMAXDOAS detected OCIO , higher OCIO columns were found inside the vortex, and a strong increase with SZA was observed.
- Off-axis telescopes saw much higher OCIO when flying into the vortex and lower values on the way back whereas the zenith pointing telescope showed only a small difference between the two parts of the flight.
- Compare with GOME and SCIAMACHY OCIO slant columns close to the time and location of the Falcon underpass, the results are similar.
- The remaining differences are related to differences in solar zenith angle and the large horizontal gradients which make OCIO validation close to the vortex edge particularly difficult.
- Further analysis and evaluation of results from more flights will have to be performed to provide a more quantitative validation of the satellite measurements.
